

Python

Page No. 4

Date

- Medium to communicate with computers.
- Every programming language has Keywords / Reserved words.
- Syntax \rightsquigarrow Set of rules
- High level language.
- Easy to learn, troubleshoot.

① Literals \rightsquigarrow Data (Building block of Python)

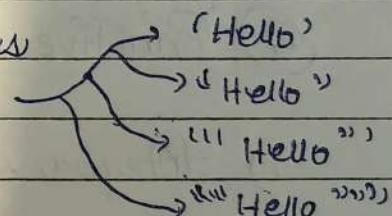

- Numeric Literal \rightarrow 1000 (Integers)
 $\left[\begin{array}{l} \rightarrow -500 \\ \rightarrow 0 \end{array} \right]$ } Integer Literal
- Float Literal \rightarrow 3.14
 $\left[\begin{array}{l} \rightarrow -5.89 \end{array} \right]$

\rightarrow 10.0 \rightsquigarrow Classified as float.

\rightarrow 10 \rightsquigarrow Integer.

- String Literal \rightsquigarrow Group/Sequence of characters
 \rightsquigarrow Enclosed within quotes.

\rightarrow "Hello,
How are you ?" } \rightarrow Multi-line

3
"Hello, In How are you ?"

\rightsquigarrow escape sequence \rightsquigarrow next line

- Boolean Literal \rightsquigarrow True/False.

- None Literal \rightsquigarrow No value

- ② Variables → Reserved memory location used to store values.
- $a = 1$
 - $\text{print}(a) \rightsquigarrow 1$
 - $x = 4$
 - $x = 3 \rightsquigarrow \text{Replace value}$
 - Begin with alphabet or -
 - Can't begin with number.
 - Variable names are case-sensitive
- $\text{del } a \rightsquigarrow \text{Deleting 'a' variable}$
- $a = "Python"$

- ③ Keywords → Special reserved words.

- for, while, def, break, if, else ...

Import keyword
Keyword, kwlist } Shows you all the
Keywords.

- ④ Primitive Datatypes.

- a) Integers $\rightsquigarrow \text{age} = 25$
 $\rightarrow \text{type}(\text{age}) \rightsquigarrow <\text{class 'int'}>$
- b) Floats $\rightsquigarrow \text{percent} = 87.5$
 $\rightarrow \text{type}(\text{percent}) \rightsquigarrow <\text{class 'float'}>$
- c) Strings $\rightsquigarrow \text{name} = "Mark"$
 $\text{type}(\text{name}) \rightsquigarrow <\text{class 'str'}>$
- d) Boolean $\rightsquigarrow \text{val1} = \text{True}$
 $\text{type}(\text{val1}) \rightsquigarrow <\text{class 'bool'}>$
- e) None $\rightsquigarrow \text{val2} = \text{None}$, $\text{type}(\text{val2}) \rightsquigarrow <\text{class 'NoneType'}>$

⑤ Strings

`→ name = 'Python'`
`len(name) → 6`

Python
0 1 2 3 4 5 \rightsquigarrow index (Positive)
-6 -5 -4 -3 -2 -1 \rightsquigarrow Negative Index.

- name [0] \rightsquigarrow P
 - name [6] \rightsquigarrow Error
 - name [-1] \rightsquigarrow last character \rightsquigarrow n
 - name [-2] \rightsquigarrow o
 - Concatenating 2 strings \rightsquigarrow $s_1 + s_2$ (Print as it is)
 \rightsquigarrow $s_1 + ' ' + s_2$ (with space)

⑥ Type Conversion / Type Casting

- Convert data-type from one another.
 - $\text{num1} = 100$ } $\rightarrow \text{num1}$ doesn't change.
 $\text{num2} = \text{float}(\text{num1}) \rightarrow 100.0$
 - $\text{num1} = \text{float}(\text{num1})$. $\rightarrow \text{num1}$ changes.
 - $\text{num3} = 56.45$ | $\text{num4} = 76.78$
 $\text{int}(\text{num3}) \rightarrow 56$ | $\text{int}(\text{num4}) \rightarrow 76 \rightsquigarrow$ Doesn't round off.
 - $\text{str}(\text{num1}) \rightarrow ('100')$
 - $s1 = ('Hello')$
 - $\text{int}(s1) \rightsquigarrow \underline{\text{Error}}$
 - $s1 = ('123')$
 - $\text{int}(s1) \rightarrow \underline{\text{works}}$
 - $s1 = ('Py3.14')$
 - $\text{int}(s1) \rightsquigarrow \underline{\text{Error}}$
 - $\text{language} = "Python"$
 - $\text{version} = 3.14$
 - $\text{language} + \text{version} \rightarrow \underline{\text{Error}}$
 - $\text{version_str} = \text{str}(\text{version})$
 - $\text{language} + \text{version_str} \rightarrow \underline{\text{ }}$

(7) Type Conversion (Boolean)

- $\text{val} \doteq \text{True}$	$\text{bool}(0.0) \rightsquigarrow \text{False}$
- $\text{str}(\text{val}) \rightsquigarrow \text{'True'}$	$\text{bool}(104) \rightsquigarrow \text{True}$
- $\text{bool}(\text{'Python'}) \rightsquigarrow \text{True}$?
- $\text{bool}(100) \rightsquigarrow \text{True}$	$\text{bool}(-100) \rightsquigarrow \text{True}$
- $\text{bool}(1.5) \rightsquigarrow \text{True}$	
- $\text{bool}(0) \rightsquigarrow \text{False}$	Only 0 gives us False.
$\xrightarrow{\quad \text{bool}(0.5) \rightsquigarrow \text{True}}$	

- $\text{bool}(\text{'hi'}) \rightsquigarrow \text{True}$
- $\text{bool}(\text{('a')}) \rightsquigarrow \text{True}$
- $\text{bool}(\text{' '}) \rightsquigarrow \text{True}$ (Space is valid character)

Empty String $\rightsquigarrow (), .(), ;(), , - ,$
 This gives us False.

- $\text{bool}(\text{None}) \rightsquigarrow \text{False}$
- $\text{int}(\text{True}) \rightarrow 1, \text{int}(\text{False}) \rightarrow 0$
- $\text{float}(\text{True}) \rightarrow 1.0, \text{float}(\text{False}) \rightarrow 0.0$

(8) Arithmetic, Assignment Stuff.

a) Arithmetic Operator

- $\text{num1} = 10$	$\text{num1} \times \text{num2} \rightarrow 10 \times 5 \rightarrow 0$
- $\text{num2} = 5$	
- $\text{num1} + \text{num2} \rightsquigarrow 15$	<u>Semicircles</u>
- $\text{num1} - \text{num2} \rightsquigarrow 5$	
- $\text{num1} * \text{num2} \rightarrow 10 * 5 = 50$	$\rightarrow 3^{**} 4 \rightarrow 3^4 \rightarrow \text{Exponentiation}$
- $\text{num1} / \text{num2} \rightsquigarrow 2$ (Data type is float)	
- $\text{num1} // \text{num2} \rightsquigarrow 2$ (Data type is int) \rightarrow w/o decimal value.	

b) Assignment operator

- Value = 100
- Value += 100 \leadsto Compound Assignment Operator \rightarrow Value = Value + 100
- Value -= 150 \leadsto Value = Value - 150
- Value *= 2 \leadsto Value = Value * 2
- Value /= 4 \leadsto Value = Value / 4

⑨ Comparison & logical Operators

- $=, !=, >, <, \geq, \leq$
 - Equality Operator \rightarrow True / False
 - 'Python' == 'python' \rightarrow False.
 - Logical \rightarrow and, or, not.
- | | | |
|----------------------------------|---------------------------------|--|
| $F \text{ and } F \rightarrow F$ | $F \text{ } F \rightarrow F$ | $\text{not } F \rightarrow \text{True}$ |
| $F \text{ and } T \rightarrow F$ | $F \text{ } T \rightarrow T$ | $\text{not } F \rightarrow \text{False}$ |
| $T \& F \rightarrow F$ | $T \text{ } F \rightarrow T$ | |
| $T \& T \rightarrow T$ | $T \text{ } T \rightarrow T$ | |

⑩ Precedence

- $5 + 10 * 6 \leadsto 65$. name = "Mark", age = 25
 - name == "Mark" or name = "John" and age < 18.
- \downarrow \downarrow \downarrow
 T F F
 \swarrow \searrow \swarrow
 F T T
 \searrow \swarrow
 True or False \rightarrow True \rightarrow ✓
- And operators first

$$- \frac{2 * 1 + 3}{\downarrow}$$

$$\rightarrow 2^1 * 3 \rightarrow 2^3 = 8 \rightarrow X$$

$$\Rightarrow 1^3 = 1, 2^1 = 2 \rightarrow \text{_____}$$

\rightarrow Associativity \rightarrow Right to left exponentiation.

* Classification of operators based on no. of operators.

i) Unary $\rightarrow ++x, -x$ etc.

\rightarrow not True, not False.

ii) Binary $\rightarrow 10 - 5 = 5$.

\rightarrow True or False \rightarrow True

iii) Ternary $\rightarrow ? :$

⑪ Print()

- name = "John"

Print(name)

- print(name, age) \rightarrow John 20

\downarrow

Space separator.

- print(10, 20, 30, 40, Sep = "-") \rightarrow 10-20-30-40

- print(10, 20, 30, 40, Sep = ",") \rightarrow 10,20,30,40

- print("Addition of", num1, "and", num2, "is", num1 + num2)

(12) input()

- `first-name = input()`
- * `John`
- `print(first-name)` ~> `John`
- `last-name = input("Enter your last name")`
- * `Enter your last name Radha`
- `num1 = input("Enter Number: ")`
- * `Enter number: 10.`

- Input is received as String
- ~~int~~ - Convert numbers to integers for any operations.

(13) Pycharm Video.

(14) Numeric Functions

- `print(max(1, 2, 3, 4, 5))` → 5
- `print(min(1, 2, 3, 4, 5))` → 1
- `print(abs(-2020))` → 2020
- `print(pow(2, 3))` → $2^3 = 8$
